

Faytech's transparent OLED Kiosk Solution

Dear Customer

The future is now!

We are pleased to announce, that our revolutionary faytech T-OLED KIOSK is ready for launch!

Featuring an ultra-thin, ultra-clear and crisp display like no other, this marks a giant leap into the next generation of captivating and eye-catching self-ordering technology that helps draw customers and orders into any quick-service or fast casual restaurant.

But of course this technology is not limited to this particular application. Think of any transparent or reflective surface and ask yourself: would this application benefit from a (touch) display?

This could be a fridge switching between transparent front and Display front or a mirror adding information to the reflected image or a transparent section of a machine that could also be used as HMI. There is an endless amount of possible applications only limited by ones imagination.

The ultra-flat (0.3"), vivid, bright, and semi-transparent 30" touchscreen is an attention grabber, as evidenced at this year's CES and EuroCIS, demonstrating the faytech T-OLED KIOSK's coolness and WOW factor.

Simply spectacular:

When operating the UI, guests will not only be blown away by the touchscreen's colorfulness and ultra-high contrast ratio, or the power of the high-speed Intel mainboard inside, but they'll also be able to see through to the environment behind! This creates the ultimate "aha" experience!

Our brand-new kiosk fits unobtrusively and seamlessly into any store or restaurant environment, without compromising its openness and design. Thanks to the transparent touchscreen, the faytech T-OLED KIOSK is the best choice for smaller spaces where traditional displays obstruct views or cause claustrophobic consumer experiences. Lightweight design with OLED technology and aluminum housing by faytech make the system a quick and easy installation as well!

We are now ramping up production and are welcoming sample orders. Don't miss out!
